Compa

re: Data Scientist

I was excited to find this job opportunity is still open! I can assure you that I have been the work I have done the past years. I am very excited to continue to do so, and I am confident that the role of Data Scientist at Compa can be taken in my hands.

Dear Sir, I am very pleased to work in my application for the Data Scientist, thank you for spending time reading my letter. I have lots of passion for what I do, working with data and specifically machine learning have left a unique perspective that I wish nothing more than to keep building upon and to bring value with my skills. I feel so grateful that this universe has been letting me keep building on my career, as you know anything and almost everything can happen from one day to the other. I am willing to start a new position and put myself as a student as I believe that in Compa I have lots to learn. I know that my 4 years of experience working mostly as a Data Scientist has lots of value. My name is Yeriko Vargas, and after graduating from my masters in applied stats I had the chance to jump right in the industry, my every first project was a tornado as I was taken a full FCA optimization project by myself, with a support from an advisor. coming from Statistics to straight Deep Learning project was not easy but this just shows how I am able to break apart big challenges.

The opportunity of Data Scientist at Compa, would be best if taken into my hands. As Data Scientist I have had the opportunity to do so. I am now working as a freelance at CAI and I recently started to * CAI -> job description matching jd : which I have some experience doing more of. Also the way I worked at CAI started expanding in my toolbelt with machine learning. The experience I experienced so much at FORD, where I * FORD -> job description matching jd : * Managed big data from CVDOS database to meet internal client data requirements using Python. Enhanced internal data analysis and reporting. Utilized Python for data manipulation and analysis. * Transformed, merged, and visualized data sets using Python, AWS SageMaker, and Jupyter notebooks. Streamlined data visualization and reporting for daily updates. Employed Python, AWS SageMaker, and Jupyter for data transformation. * Collaborated with engineers and project managers to address car defects using Machine Learning. Implemented ML solutions for recurring car defects. Applied Cluster Analysis and PCA methodology in Machine Learning. * Automated process for transferring live data and statistics to internal customers using Python, SQL, and Hadoop. Reduced human error in data transfer processes. Implemented Python, SQL, and Hadoop for automation. and I * ['FCA'] -> job description matching jd : * Applied Neural

Network methods to solve automotive storage optimization problem using python *

- Extracted and analyzed data coming from different databases to optimize Machine Learning algorithms * . Used Multiple Regression Logistic models to reduce the numbers of predictors from 108 to 14 predictors using the misclassification table from complex results, using R and double-checking the results with SAS * . Optimize neural networks to analyze data set containing a quarter million cars, by providing histograms, data types and statistics of the unbalanced 5135 different categories *
- Modeled the data to find which categories of cars led to the highest profits, the dependent variable was the net margin of a well-recognized car brand, independent variables were the 108 binary codes as elements of each car

I have experienced Statistics and data manipulation work in detailed and I have gained so much understanding around this topic, and I can assure you I have what it takes to help as Data Scientist.

Thank you I believe that there is so much I could passionately talk more in detail about my experiences. I think that the purpose of the Data Scientist at Compa closely matches my careergoals as well. I really would be so happy and excited to have the chance to speak with someone and learn more about this position, as I want to find a deal to work here at Compa as for the Data Scientist position

All best,
Yeriko Vargas
